## Abstract

In the present paper, the author has established two theorems namely Initial-Value theorem and Final-Value theorem of Sadik transform and verification of these theorems are given. The authors feel that these theorems are very useful in Physics and Mathematics.

Key words: Sadik Transform, Initial-Value theorem, Final-Value theorem.

## 1. Introduction

### Definitions

#### (i) Laplace Transform

Let  $f(x)$  be a real or complex valued function defined for  $x > 0$ , then the Laplace transform of  $f(x)$ , denoted by  $L\{f(x); p\}$  or  $F(p)$  or  $\overline{F}(p)$  is defined as

$$L\{f(x); p\} = \overline{F}(p) = \int_0^{\infty} e^{-px} f(x) dx = \lim_{T \rightarrow \infty} \int_0^T e^{-px} f(x) dx \quad (1.1)$$

Provided that the limit exists and finite.

#### (ii) Libnitz's rule for differentiating under integral sign

Let  $f(x, t)$  and  $\frac{\partial f}{\partial x}$  are continuous functions of both variables  $x$  and  $t$  and let the first order derivatives of  $g(x)$  and  $h(x)$  are continuous, then

$$\frac{d}{dx} \int_{g(x)}^{h(x)} f(x, t) dt = \int_{g(x)}^{h(x)} \frac{\partial f}{\partial x} dt + f(x, h(x)) \frac{dh}{dx} - f(x, g(x)) \frac{dg}{dx} \quad (1.2)$$

#### (iii) Sumudu Transform

If  $f(t) \in \{f(t) : M, k_1, k_2 > 0, |f(t)| < M \cdot \exp(t/k)\}$

Then the Sumudu transform of  $f(t)$  is defined by

Volume 2, Issue 7, July 2015

$$F(u) = S[f(t)] = \int_0^{\infty} e^{-t} f(u, t) dt \quad (1.3)$$

Where the integral of R.H.S. of (1.3) is convergent.

## (iv) Sadik Transform

Sadikali Latif Shaikh<sup>[1]</sup> has been defined Sadik transform in the following manner:

If  $f(t)$  is piecewise continuous on the interval  $0 \leq t \leq A$  for any  $A > 0$  and  $|f(t)| \leq K.e^{w^a t}$  when  $t \geq M$ , for any real constant  $w^a$  and some positive constant  $K$ . Then the Sadik transform of  $f(t)$  is given by

$$F(v^\alpha, \beta) = S[f(t)] = \frac{1}{v^\alpha} \int_0^{\infty} e^{-v^\alpha t} f(t) dt, \text{ for } \operatorname{Re}(v^\alpha) > w^a \quad (1.4)$$

Where  $v$  is complex variable,  $\alpha$  is any non-zero real numbers and  $\beta$  is any real number.

For  $\alpha = 1, \beta = 0$  the Sadik transform reduces to the Laplace transform and for  $\alpha = -1, \beta = 1$  it, the Sadik transform reduces to the Sumudu transform.

Some known results of Sadik transform<sup>[3]</sup>:

(i) If  $f(t) = t^n$ , then Sadik transform of  $f(t) = t^n$  is

$$S[t^n] = F(v^\alpha, \beta) = \frac{n!}{v^{(n+1)\alpha + \beta}} \quad (1.5)$$

$$(ii) S[\sin at] = F(v^\alpha, \beta) = \frac{av^{-\beta}}{v^{2\alpha} + a^2} \quad (1.6)$$

$$(iii) S[\cos at] = F(v^\alpha, \beta) = \frac{v^{\alpha-\beta}}{v^{2\alpha} + a^2} \quad (1.7)$$

$$(iv) S[\sinh at] = F(v^\alpha, \beta) = \frac{av^{-\beta}}{v^{2\alpha} - a^2} \quad (1.8)$$

$$(v) S[\cosh at] = F(v^\alpha, \beta) = \frac{v^{\alpha-\beta}}{v^{2\alpha} - a^2} \quad (1.9)$$

$$(vi) S[e^{at}] = F(v^\alpha, \beta) = \frac{v^{-\beta}}{v^\alpha - a} \quad (1.10)$$

Volume 2, Issue 7, July 2015

(vii) If  $G[x, v^\alpha, \beta]$  is a Sadik transform of  $\varphi(x, t)$  and  $\varphi_t(x, t)$  is a first order partial derivative of  $\varphi(x, t)$  with respected to  $t$ , then

$$S[\varphi_t(x, t)] = v^\alpha G(x, v^\alpha, \beta) - v^{-\beta} \varphi(x, 0) \quad (1.11)$$

(viii) If  $G[x, v^\alpha, \beta]$  is a Sadik transform of  $\varphi(x, t)$  and  $\varphi_{tt}(x, t)$  is a second order partial derivative of  $\varphi(x, t)$  with respected to  $t$ , then

$$S[\varphi_{tt}(x, t)] = v^{2\alpha} G(x, v^\alpha, \beta) - v^{\alpha-\beta} \varphi(x, 0) - v^{-\beta} \varphi_t(x, 0) \quad (1.12)$$

## 2. Theorems

In this section, we will establish Initial-Value theorem and Final-Value theorem of Sadik transform and verification of these theorems are also given.

### Theorem1. Initial-Value Theorem

Let  $f(t)$  be continuous for all  $t \geq 0$  and be of exponential order as  $t \rightarrow \infty$ . Also suppose that  $f'(t)$  is of class  $A$ , then

$$\lim_{t \rightarrow 0} f(t) = v^\beta \lim_{v^\alpha \rightarrow \infty} v^\alpha S\{f(t)\} \quad (2.1)$$

**Proof:** By the result (1.11), we have

$$S\{f'(t)\} = v^\alpha S\{f(t)\} - v^{-\beta} f(0)$$

$$\text{Or } \frac{1}{v^\beta} \int_0^\infty e^{-v^\alpha t} f'(t) dt = v^\alpha S\{f(t)\} - v^{-\beta} f(0) \quad (2.2)$$

But if  $f'(t)$  is sectionally continuous and of exponential order, we have

$$\lim_{v^\alpha \rightarrow \infty} \int_0^\infty e^{-v^\alpha t} f'(t) dt = 0. \text{ Taking limit as } v^\alpha \rightarrow \infty \text{ in (2.2), we find that}$$

$$0 = \lim_{v^\alpha \rightarrow \infty} v^\alpha S\{f(t)\} - v^{-\beta} f(0)$$

$$\text{Or } f(0) = v^\beta \lim_{v^\alpha \rightarrow \infty} v^\alpha S\{f(t)\} \quad (2.3)$$

Since  $f(t)$  is continuous at  $t \rightarrow 0$ , we have

$f(0) = \lim_{t \rightarrow 0} f(t)$ . Thus (2.3) gives

$$\lim_{t \rightarrow 0} f(0) = v^\beta \lim_{v^\alpha \rightarrow 0} v^\alpha S \{f(t)\}$$

### Theorem2. Final-Value Theorem

Let  $f(t)$  be continuous for all  $t \geq 0$  and be of exponential order as  $t \rightarrow \infty$ . Also suppose that  $f'(t)$  is of class  $A$ , then

$$\lim_{t \rightarrow \infty} f(t) = v^\beta \lim_{v^\alpha \rightarrow 0} v^\alpha S \{f(t)\} \quad (2.4)$$

**Proof:** By the result (1.11), we have

$$S \{f'(t)\} = v^\alpha S \{f(t)\} - v^{-\beta} f(0)$$

$$\text{Or } \frac{1}{v^\beta} \int_0^\infty e^{-v^\alpha t} f'(t) dt = v^\alpha S \{f(t)\} - v^{-\beta} f(0) \quad (2.5)$$

The limit of the L.H.S. of (2.5) as  $v^\alpha \rightarrow \infty$  is

$$\begin{aligned} \lim_{v^\alpha \rightarrow \infty} \frac{1}{v^\beta} \int_0^\infty e^{-v^\alpha t} f'(t) dt &= \frac{1}{v^\beta} \int_0^\infty f'(t) dt = \\ \lim_{T \rightarrow \infty} \frac{1}{v^\beta} \int_0^T f'(t) dt &= \lim_{T \rightarrow \infty} \left\{ \frac{f(t) - f(0)}{v^\beta} \right\} = \lim_{T \rightarrow \infty} \frac{f(t)}{v^\beta} - \frac{f(0)}{v^\beta} \end{aligned}$$

The limit of the R.H.S. of (2.5) as  $v^\alpha \rightarrow 0$  is

$$\lim_{v^\alpha \rightarrow 0} v^\alpha S \{f(t)\} - v^{-\beta} f(0).$$

$$\text{Thus } \lim_{t \rightarrow \infty} \frac{f(t)}{v^\beta} - v^{-\beta} f(0) = \lim_{v^\alpha \rightarrow 0} v^\alpha S \{f(t)\} - v^{-\beta} f(0)$$

$$\text{Or } \lim_{t \rightarrow \infty} f(t) = v^\beta \lim_{v^\alpha \rightarrow 0} v^\alpha S \{f(t)\}$$

### Verification of Initial-Value theorem and Final-Value theorem

$$\text{Let } f(t) = e^{-2t}, \text{ then } S \{e^{-2t}\} = \frac{v^{-\beta}}{v^\alpha + 2} \text{ (by using (1.10))}$$

# International Journal of Multidisciplinary Research in Science, Engineering, Technology & Management (IJMRSETM)

| A Monthly Double-Blind Peer Reviewed Journal |

Volume 2, Issue 7, July 2015

The Initial-Value theorem is

$$\lim_{t \rightarrow 0} f(t) = v^\beta \lim_{v^\alpha \rightarrow \infty} v^\alpha S \{f(t)\}$$

$$\text{Here } \lim_{t \rightarrow 0} e^{-2t} = 1 \text{ and } v^\beta \lim_{v^\alpha \rightarrow \infty} v^\alpha S \{f(t)\} = v^\beta \lim_{v^\alpha \rightarrow \infty} \frac{v^{-\beta} v^\alpha}{v^\alpha + 2} = 1$$

Hence the Initial-Value theorem is verified.

The Final-Value theorem is

$$\lim_{t \rightarrow \infty} f(t) = v^\beta \lim_{v^\alpha \rightarrow 0} v^\alpha S \{f(t)\}$$

$$\text{Here } \lim_{t \rightarrow \infty} e^{-2t} = 0 \text{ and}$$

$$v^\beta \lim_{v^\alpha \rightarrow 0} v^\alpha S \{f(t)\} = v^\beta \lim_{v^\alpha \rightarrow 0} \frac{v^{-\beta} v^\alpha}{v^\alpha + 2} = 0.$$

Hence the Final-Value theorem is verified.
